July 20, 1935. No. 13276/36.  
July 20, 1935. No. 13277/36.

Application Date (in United Kingdom). May 11, 1936.

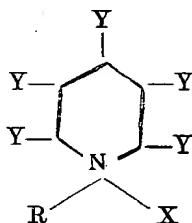

Specification not Accepted

### COMPLETE SPECIFICATION

#### Process for Disinfecting and Preserving

We, CHEMISCHE FABRIK VON HEYDEN AKTIENGESELLSCHAFT, a body corporate organised according to the laws of Germany, of Radebeul - Dresden, Germany, do hereby declare the nature of this invention and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement:—

10 This invention is based on the discovery that by the addition of a suitable reactive compound R—X to a pyridine compounds having a high bactericidal action can be obtained. The new compounds are accordingly quaternary pyridines of the general formula

In this formula Y stands for hydrogen or any desired residues which may be the same or different, R stands for any desired organic residue and X for any desired organic or inorganic anion.

As suitable compounds there may be named by way of example:

25 The addition products of alkyl halides and pyridine, for example  
Dodecylpyridinium chloride,  
Tetradecylpyridinium chloride,  
Cetylpyridinium chloride,  
30 Octadecylpyridinium chloride  
and others, or addition products of alkyl halides and homologues of pyridine, for example  
Cetyl- $\alpha$ -picolinium chloride.

[I]

Cetyl- $\gamma$ -n-propylpyridinium chloride, 35  
Tetradecyl -  $\gamma$  - isoamylpyridinium chloride.

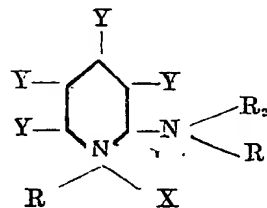

It is also possible to combine with pyridine or its homologues by addition a compound containing an oxy-group such as ethylene chlorhydrin or  $\alpha$ -chlorhydrin and then to esterify the oxy-group, for example with lauric acid, myristic acid, stearic acid or oleic acid. Or an amine such as dodecylamine, tetradecylamine, hexadecylamine, octadecylamine or a 2-alkoxy-5-aminopyridine may be converted into an amide of a halogen carboxylic acid such as chloracetic acid and the amide thus obtained may be combined with a pyridine by addition.

The invention is also based on the discovery that certain  $\alpha$ - or  $\gamma$ -pyridonimides and quaternary  $\alpha$ - or  $\gamma$ -aminopyridines have a high bactericidal action which renders them suitable for extensive use in cases where the extermination of micro-organisms comes into consideration.

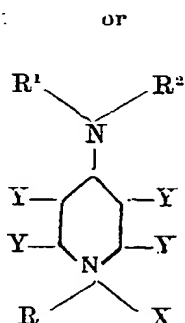

There come into question compounds in which one Y in the foregoing formula

has been replaced by the  $\text{—N} \begin{matrix} \text{R}_2 \\ \text{R}_1 \end{matrix}$  group

and to which there may probably be attributed, in the form of their salts, the following formulæ:

65

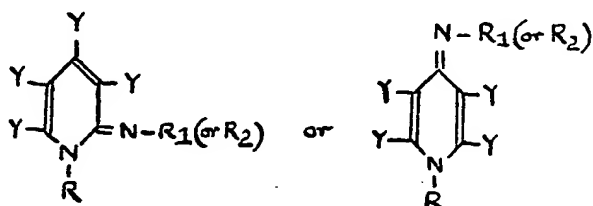

in which X represents any desired organic or inorganic anion, advantageously a halogen atom or a derivative of sulphuric acid, Y represents any desired residues which may be the same or different, R represents any desired organic residue, for example an alkyl group or an aralkyl group, and R<sub>1</sub> and R<sub>2</sub> represent hydrogen or any desired organic residues which may

be the same or different. The residues R<sub>1</sub> and R<sub>2</sub> may be linked to the α- or γ-amino nitrogen atom either in the manner of an amine, for example in the case of alkyl, cycloalkyl, aralkyl, aryl or heterocyclic groups, or in the manner of an amide in the case of radicals of saturated or unsaturated fatty acids or cycloaliphatic, aromatic-aliphatic, aromatic or heterocyclic acids. The residues R, R<sub>1</sub> and R<sub>2</sub> may also be substituted in any desired manner, for instance by halogen atoms, ether or thioether groups, amino groups and so on or their carbon chains may be interrupted by other atoms.

According to the solubility required of the compounds they may be used in the form of their salts of various acids. If required the free bases may be prepared from the salts and may be used as such.

If R<sub>1</sub> and/or R<sub>2</sub> is hydrogen the free bases are of low solubility and pass with loss of water or acid into pyridonimides represented by the following formulae:

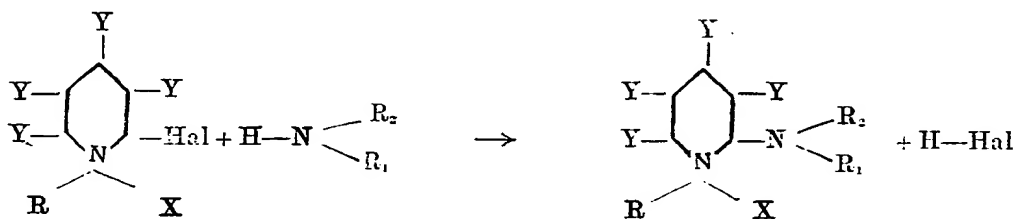

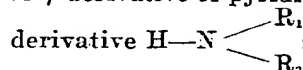

Depending on their solubility these may be used either as such or in the form of their salts with suitable acids.

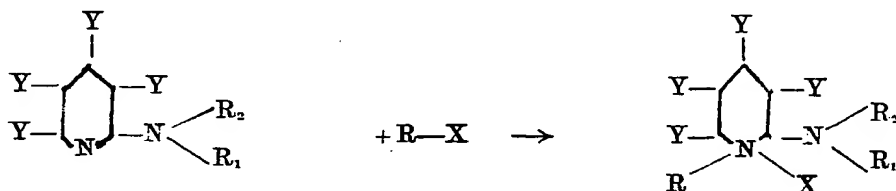

Compounds of the aforesaid kind are obtainable according to various methods, some of which are known. Without exhausting all possibilities the following

reactions may be named:

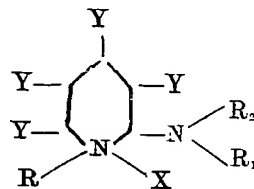

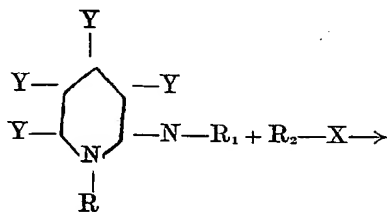

The reaction of a quaternary α- or γ-halogen pyridine (or another suitable α- or γ-derivative of pyridine) with an amine

the addition of a reactive compound R-X (X=a halogen atom or a corresponding reactive negative group) to an α- or γ-aminopyridine:

the addition of a reactive compound  $R_2-X$  (for example a reactive alkyl or aralkyl halide or an acid halide) to an  $\alpha$ - or  $\gamma$ -pyridonimide

For the application of the compounds 5 as preserving and disinfecting agents the particular manner in which they are prepared is, of course, of no importance.

The active products in the form of their salts are in most cases colourless or faintly yellow, but rarely more deeply coloured compounds according to the manner in which they are made and their composition. They dissolve freely in water to solutions of nearly neutral reaction. Many members of the series also dissolve freely in organic solvents. Many of the substances have an appreciable capacity for promoting wetting, foaming and emulsifying, whereby their sphere of application is further enlarged.

The compounds can be used either in the chemically pure state or in the crude state. Furthermore they may be used in suitable admixture with one another or may be prepared from mixtures of parent materials. They may also be used in the form of mixtures or emulsions with other substances, which may be indifferent or may also be active.

According to the required solubility the compounds may be used in the form of their salts or in the form of the free bases. They have a very high bactericidal activity.

Examples of substances which may be used in accordance with the invention are the following:

1. N-Methyl- $\alpha$ -pyridone - stearoylimide hydrochloride.

2. N - Methyl -  $\alpha$  - pyridone - cetylimide hydrochloride.

3.  $\alpha$  - cetylbenzylamino - N - methylpyridinium bromide (obtained by reaction of 1 Mol. of N-methyl- $\alpha$ -pyridone-cetyl-  
imide with 1 Mol. of benzyl bromide).

4.  $\alpha$ -Phenyl-stearoylamino - N - methylpyridinium chloride (obtained by the action of 1 Mol. of stearic acid chloride on 1 Mol. of N-methyl- $\alpha$ -pyridone-phenyl-  
imide; purified by dissolution in water and precipitation by dilute hydrochloric acid).

5.  $\alpha$ -Naphthyl-nonoylamino-N-methyl-

pyridinium chloride (obtained by the action of 1 Mol. of *n*-nonylic acid chloride 55 on 1 Mol. of N-methyl- $\alpha$ -pyridone-naphthylimide, purified with ether).

6. N-cetylpyridinium chloride.

7. N-Cetyl- $\alpha$ -picolinium chloride.

8. Reaction product of cetyl chloride 60 and  $\gamma$ -piperidinopyridine (apparently a  $\gamma$ -piperidino-N-cetylpyridinium chloride).

9. Reaction product of octadecyl chloride and  $\gamma$ -diethylaminopyridine (apparently a  $\gamma$ -diethylamino-N-octa-  
decylpyridinium chloride).

10. Addition product of dimethyl sulphate and 3-stearoylamino-N-methyl-  
pyridinium methosulphate).

The following may be given by way of illustration of the pronounced activity of the foregoing substances:

A suspension of *Bacillus Coli* is treated for  $\frac{1}{2}$  hour with a dilute aqueous solution 75 of the substance. It is then spread on an Agar plate and the growth of the Bacilli is observed. The Bacilli are killed at concentrations up to those shown in the following table: 80

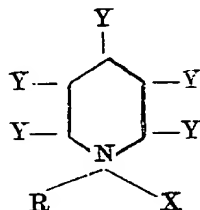

Compound No.	No growth at concentration of	
1	1: 25000	
2	1: 50000	
3	1:100000	85
4	1: 5000	
5	1: 10000	
6	1:100000	
7	1:100000	
8	1:100000	90
9	1:100000	
10	1: 25000	

Instead of using the substances in aqueous solution they may be used in alcoholic solution or in solution in another 95 suitable solvent.

Having now particularly described and ascertained the nature of our said invention and in what manner the same is to be

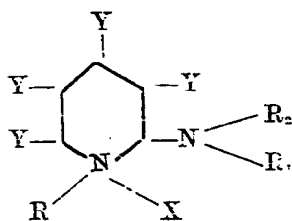

performed, we declare that what we claim is:—

1. A process for disinfecting and preserving, wherein there is used as  
5 disinfecting or preserving agent a quaternary pyridine of the general formula

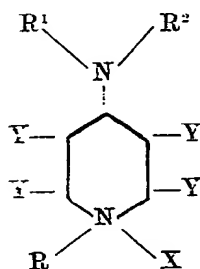

- 10 in which X represents any desired anion or a hydroxyl group, Y represents hydrogen or any desired substituents which may be the same or different and R represents any desired organic residue.

2. A process as claimed in Claim 1,  
15 wherein there is used a derivative of an  $\alpha$ - or  $\gamma$ -aminopyridine of the general formula

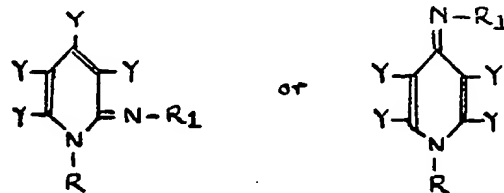

or

in which X, Y and R have the meanings 20 indicated in Claim 1 and R<sub>1</sub> and R<sub>2</sub> represent hydrogen or the same or different organic residues.

3. A process as claimed in Claim 2  
25 wherein in the general formula given in Claim 2 one or both of the residues R<sub>1</sub> and R<sub>2</sub> represents an acyl residue bound to the nitrogen in the manner of an amide.

4. A process of disinfecting or preserv-  
ing, wherein there is used as disinfecting 30 or preserving agent a pyridonimide of the formula

derived by the elimination of water or the  
acid H—X from a compound of the 35 formula given in Claim 2 in which X, Y, R and R<sub>1</sub> have the meaning therein given and R<sub>2</sub> means hydrogen.

5. A process of disinfecting or preserv-  
ing, wherein there is used as a disinfect- 40 ing or preserving agent any of the compounds 1—10 herein named.

6. A manufacture of disinfectant  
preparations by mixing an agent defined 45 in any of claims 1—5 with another such agent or with another substance.

7. A manufacture of disinfectant  
preparations by dissolving or dispersing 50 in a liquid an agent defined in any of claims 1—5.

8. Disinfectant preparations obtainable  
by the manufacture claimed in claim 6 or 7.

Dated this 11th day of May, 1936.
